

AURALIS

THE ART OF SILENCE

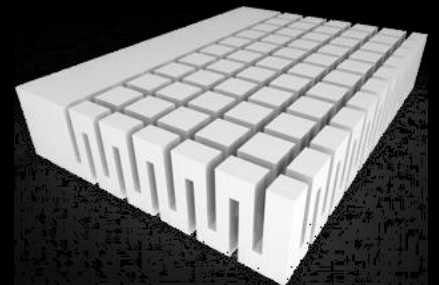

massive lime wood

Incision type **DUNA**

DUNA is special among the dukta cut types because it can only be made with solid wood. The intersecting cuts cause the wood to deform "3-dimensionally". The grid-like cut pattern shows squares and is identical on both sides. Manufacture and application are extremely demanding.

The incision type DUNA is different to the other incisions, as it is only stable enough with massive wood. Through the double-sided incision grid it can be bent and twisted «3-dimensional». Manufacturing and applying DUNA is very delicate.

front & back side: massive lime wood

Technical Data

Material:	massive wood (lime wood, poplar, etc.)
Standard incision:	Cut / Bar
Min. bending radius:	Ca. 300 mm
Open area:	Ca. 15%
Standard dimensions:	depending on the wood type
Surface:	Raw, oiled
